Hoover Dam - Penstock Anchors

The Hoover Dam, in Boulder City, Nevada was originally constructed in 1936 -- to control flooding and provide water for the southwest regions of the United States. ¼ of a mile under the dam, Spectra Company is working to repair the concrete that supports and anchors the Penstock pipes which

transport water to the energy extracting turbines. Spectra's scope of work includes concrete spall repair and epoxy injection.

Date Street Rehabilitation

The 100 & 200 Date Street buildings were constructed in the 1930's and 40's by the Bureau of Mines for laboratory and office space in Boulder City, NV. In 2007, the Bureau of Reclamation began addressing seismic and structural issues. Since the properties were part of the

City's Historic District, Spectra Company was brought in to provide rehabilitation and restoration. Once completed, the buildings will serve as office space and conference facilities for the Bureau of Reclamation. Spectra's scope of work includes: restoration painting, steel windows, masonry, architectural woodwork, metal truss and metal shell restoration.
